Rounding and Estimation

Example: Rounding to Decimal Places

Question: Round 3.44 to 1 decimal place.

When rounding to a given number of decimal places, we are always rounding to a number with at most this number of decimal places.

Example: Rounding to Decimal Places

Question: Round 3.44 to 1 decimal place.

When rounding to a given number of decimal places, we are always rounding to a number with at most this number of decimal places.

In this case, that means the answer must have 1 decimal place. What are the possible answers therefore?

Example: Rounding to Decimal Places

Question: Round 3.44 to 1 decimal place.

When rounding to a given number of decimal places, we are always rounding to a number with at most this number of decimal places.

In this case, that means the answer must have 1 decimal place. What are the possible answers therefore?

It has to be one of the two closest numbers with 1 decimal place:

$$3.4 < 3.44 < 3.5$$

. . .

The first decimal place will either round up to 5 or down to 4. This is called the **rounding digit**.

Example: Rounding to Decimal Places

Question: Round 3.44 to 1 decimal place.

When rounding to a given number of decimal places, we are always rounding to a number with at most this number of decimal places.

In this case, that means the answer must have 1 decimal place. What are the possible answers therefore?

It has to be one of the two closest numbers with 1 decimal place:

$$3.4 < 3.44 < 3.5$$

. . .

The first decimal place will either round up to 5 or down to 4. This is called the **rounding digit**.

How we decide depends on the following digit, which we call the **deciding digit**.

Example: Rounding to Decimal Places

Question: Round 3.44 to 1 decimal place.

When rounding to a given number of decimal places, we are always rounding to a number with at most this number of decimal places.

In this case, that means the answer must have 1 decimal place. What are the possible answers therefore?

It has to be one of the two closest numbers with 1 decimal place:

$$3.4 < 3.44 < 3.5$$

. . .

The first decimal place will either round up to 5 or down to 4. This is called the **rounding digit**.

How we decide depends on the following digit, which we call the **deciding digit**.

$$3.(4)4 \rightarrow 3.4$$
